1 Software Overview

1.1 What is EdgeLink?

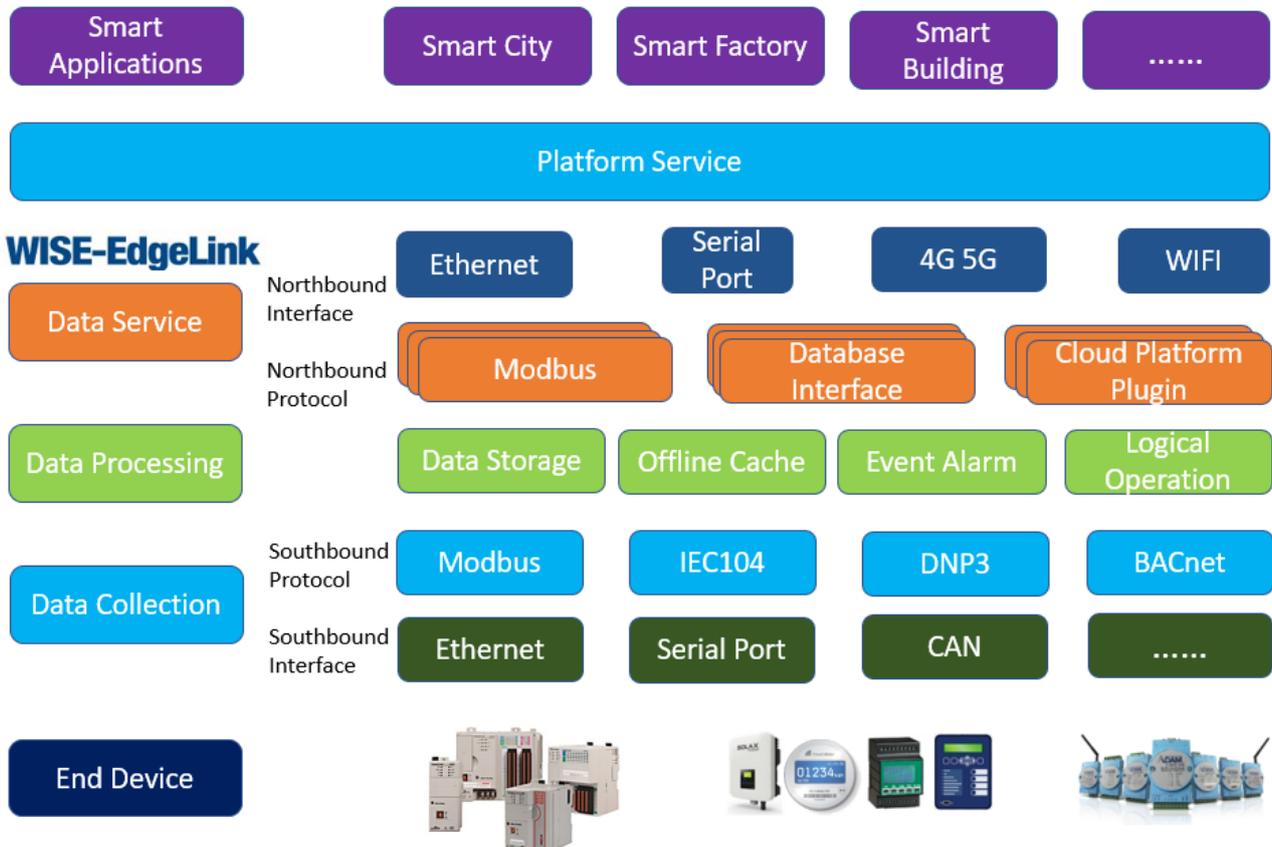

In application scenarios, a gateway connects to various smart devices via the southbound interface and connects with different platforms via the northbound interface. In IoT-based businesses, a gateway acts as the IoT big data core hub, which manages data collection, processing, and forwarding, and is located in the middle layer between devices and platforms.

EdgeLink is a software system applied to Advantech gateway. It consists of EdgeLink Studio and EdgeLink Runtime.

EdgeLink Studio: a gateway configuration tool for off-line communication and network interface configuration. It supports one-click downloads to the gateways and supports online device status management and monitoring.

EdgeLink Runtime: EdgeLink services running on the gateway. It implements configurations set by EdgeLink Studio.

1.2 System Architecture

1.3 Features of EdgeLink

- Configure a gateway with Windows utility
- Support the collection and forwarding of multiple southbound and northbound communication protocols, such as MQTT, AMQP, LwM2M, OPC UA, Modbus, IEC-104, DNP3.0, etc.
- 'One-click' downloads for data communication and network configurations
- Unified device networking management
- Real-time gateway status monitoring

1.4 Function List

Function List	Function Classification	Function Description
Project Management	Project Setup	Setup a new project: Create a project file via EdgeLink Studio.
		Upload current projects of the gateway by using on-line devices.
	Implementation methods: Single gateway download Batch gateway download	On-line implementation There are 3 ways to recognize the node: Node ID (Gateway hardware DIP switch for identifying the gateway) IP/domain name (Gateway network information which can be obtained by searching) Azure connection string (Connection string provided by Microsoft Azure)
		Off-line implementation: Export the project to SD card, and manually import it to the device.
	Gateway replication	Make a copy of gateway configuration in the project.
	Show project tag count	Show the total number of tags in the project. (System tags are not included.)
	Add and delete device	Devices connected to the gateway can be managed flexibly.
	Excel import and export (all tags)	Export tags to Excel for further editing and import tags into the project.
Data Collection	Collect data from southbound interface	Ports: Ethernet Serial port CAN USB

		Devices: Southbound protocol Parameter configuration Add tag Tag property Device template
	System tag	Basic information and hardware status of the gateway.
	User tag	Virtual IO tag which can be selected and configured by the user.
	Calculated tag	Calculated results of an expression.
Data Processing	Data storage	Store data to the expansion card. Store data of Container to the /data path. Resume broken transfer: When network interrupt/recovery occurs during data forwarding, the data generated during the interrupt can be retransferred.
	Logic operation	Support complex logical operations.
	Event trigger (alarm)	Alarm modes: Sending SMS Sending e-mail Writing tag
	Data transmission	Different devices in the field can assign each other.
	Industry protocol	Electric power: DNP3 Electric power: IEC104 BA: BACnet Common industrial protocol: Modbus Advantech Proprietary protocol: WASCADA OPC-UA
