- ✓ **robust metal housing**
- ✓ **different lengths**
- ✓ **connection with cable, M8-, M12- or microchange-connector (mc)**

**manyfold output signals  
and connection possibilities**

**description**

An important feature of these sensors is the cast electronics in a stable, metal housing. As a consequence of the compound, the electronics are perfectly protected from vibrations. As such, the devices are also sealed against fluids, except for the connector side.

They are much more resistant to mechanical stress than conventional proximity switches made from plastic.

The ambient temperature can be up to +70°C. In addition, these sensors work through the contactless detection of the object, without wear and tear.

Due to the large number of mechanical dimensions, the devices can be exchanged against many other proximity switches without any problems.

The range of applications in which these inductive sensors can be used extends, for example, from machine engineering/systems engineering, automotive industry, conveyor technology and technology for the packaging industry, technology for the printing/paper industries, chemical engineering and process engineering (as well as many others).

An inductive sensor (proximity switch, position sensor, initiator) is a contactless switch which reliably detects

metallic objects. In the case of inductive proximity switches, a correction factor is stated which evaluates the reduction of the sensing range in relation to the different materials that the objects are made from. This factor depends on the type, characteristics (internal structure), size and geometry of the material that the object to be detected is made from. The stated sensing range value relates to steel (factor 1 steel). In order to assess the approximate sensing range for materials which differ from this, the value has to be multiplied by the appropriate correction factor.

To achieve the maximum sensing range, care should be taken in relation to the size and characteristics of the object to be detected (standard target and/or flat surface).

**application examples**

- ▶ integration in automation technology machine parts
- ▶ checking the presence of metal parts with various dimensions
- ▶ detecting object heights, e.g. metal parts on conveyor belts
- ▶ detection of objects through the walls of non-metallic containers and tubes

## 1100 norm sensing ranges, increased sensing ranges

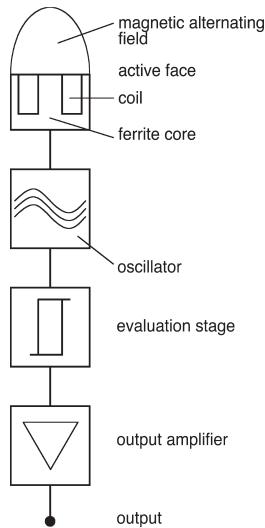

### notes on inductive proximity switches

- I inductive sensor
- IA flush, **preferential types**
- IB flush, standard and short design, top-series
- IM non-flush, **preferential types**
- IN non-flush, standard and short design, top-series

### function

The oscillation coil behind the active surface of the proximity switch produces an alternating electromagnetic rotational current field. Any electrically conductive material entering the field will induce rotational currents extracting energy from the oscillating circuit.

The damping of the oscillator is then converted into a switch signal in the output amplifier. It follows from the functional principle that all metals are detected, moving or not. Important: The high frequency field produces no measurable increase in temperature and no magnetic influence inside the object to be detected. That means the sensors operate without interacting with the system.

functional principle of an inductive proximity switch

### sensing range / norm trimming plate

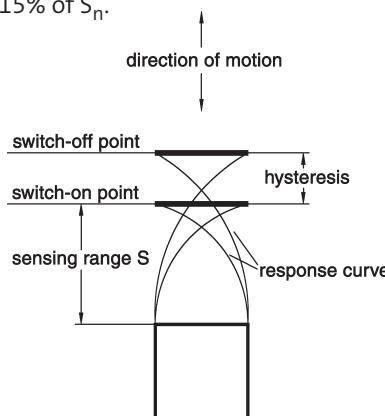

The distance to the sensor surface, where a metal causes a change in the state, is called sensing range. This range is not the same for all metals. That is why a so-called correction factor has been specified for the respective metal, e.g. copper or aluminium. The nominal sensing range  $S_n$  is determined by a norm trimming plate. This is a quadratic metal plate made from steel (St37) with a thickness of 1mm and a smoothed face. The edge length is  $3 \times S_n$  if  $3 \times S_n$  is larger than the diameter of the active face, otherwise the edge length is the same as the diameter of the active face.

One differentiates between the normal sensing range  $S_n$ , which is determined without consideration for manufacturing tolerances or external influences, and the operational sensing range  $S_o$ .

The safe operational sensing range is between 0 and 81% of  $S_n$  ( $0 < S_o < 0.81 \times S_n$ ).

### hysteresis

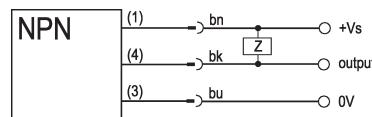

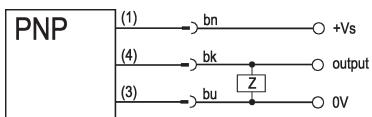

During the approach and subsequent removal of the measuring plate from the initiator there will be a difference between switch-on point and switch-off point. This integrated hysteresis prevents the switching output from oscillating during mechanical vibrations. Usually the hysteresis is between 5 to 15% of  $S_n$ .

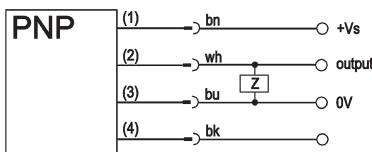

## norm sensing ranges, increased sensing ranges 1100

**output circuit**

For the switching outputs of direct current devices a differentiation is made between PNP and NPN. For PNP outputs the load is connected in such a way that it is energized (positive switching) when the sensor is driven to full output (damping). NPN devices maintain their load permanently energized, switching the earth connection only (negative switching). A corresponding wiring diagram has been enclosed with every sensor.

For devices with M12-connector and normally closed contact function (nc), the switching output is wired via PIN2. For this reason a 4-pin cable socket should be used and the connection made via the white wire.

The alternating current devices, as a rule, are 2-wire devices without short-circuit protection. Consequently a load must be connected, which allows for a minimum load current of 2mA, however, not exceeding the maximum load current. Proximity switches with analog outputs are used in the control and measurement industry. These devices produce either a linear voltage (0 ... 10V) or a current (4 ... 20mA) instead of a switch signal.

**connection in series**

For an operationally safe the connection in series of 3-wire PNP sensors a logical AND-gate, e.g. the **VL250100** is recommended.

**connection in parallel**

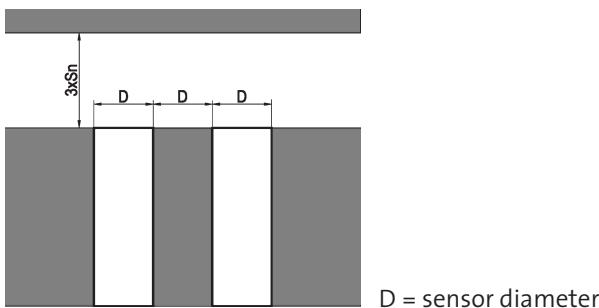

A logical OR-gate, e.g. the **VL250120**, can be used to facilitate the connection in parallel.

**mounting**

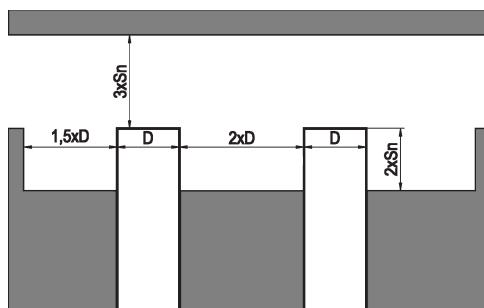

Please follow the mounting instructions for flush or non-flush sensors when installing inductive proximity switches into a metal carrier material to avoid undefined switching of the device. For a flush device the active face may be on one level with the carrier material.

Non-flush sensors must protrude. As a rule of thumb use 2x the nominal sensing range of the sensor.

## mounting instructions for flush sensors

## mounting instructions for non-flush sensors

**sampling frequency**

The sampling frequency states the maximum number of available switching operations per second. Every switching operation of the inductive proximity switch causes the oscillating circuit to move.

The time needed for this puts a limit on the sampling frequency.

For half the nominal sensing range the pulse to pause ratio should be at least 1:2, i.e. when choosing the right proximity switch, a compromise needs to be made between the size of the sensor and the sampling frequency. General rule: The larger the sensor, the smaller the sampling frequency.

**torque range**

To avoid damage when mounting proximity switches, never exceed the tightening torque given.

**stainless steel thread      nickel-plated brass thread**

M5 = 2Nm	M8 = 7Nm
M8 = 10Nm	M12 = 15Nm
M12 = 20Nm	M18 = 40Nm
M18 = 55Nm	M30 = 200Nm

**active zone/ active face**

The active zone is the area in front of the active face, within which the proximity switch reacts to the approach of metal parts, i.e. changes the state of the output.

**nominal sensing range ( $S_n$ )**

The distance at which a metal part that is approaching the active face of the proximity switch causes a change in the state of the switching output.

**repeat accuracy**

Repeatability of two measurements under standardized conditions. The difference in the measured values should be less than 10%.

**output function**

normally open contact:      object within the area of the active zone – output switched  
normally closed contact:      object within the area of the active zone – output inhibited

**correction factors**

Specify the reduction in the sensing range, if materials other than steel are used. The variance in the sensing range depends on the type, composition (internal structure), size and geometry of the material to be detected.

Typical correction factors: steel: 1 stainless steel: approx. 0.7 brass: approx. 0.4 aluminium: approx. 0.3 copper: approx. 0.2  
In order to establish the approximate sensing range of materials that deviate from steel, it is necessary to multiply the sensing range for steel by the corresponding correction factor.

**repeat accuracy**

The repeat accuracy (according to IEC 60947-5-2 / EN 60947-5-2) is the repeat accuracy of the real sensing range  $S_r$  over a period of 8 hours at an ambient temperature of  $(23 \pm 5)^\circ\text{C}$  and a defined operating voltage  $V_s$ . The specified repeat accuracy corresponds to this definition. Generally the repeat accuracy is importantly better in case of sequent measurements.

**reverse polarity protection**

An internal protection prevents the proximity switch being destroyed if the connecting leads are inverted.

**short-circuit protection (DC devices)**

An internal protection prevents the proximity switch being destroyed in the event of overcurrent.

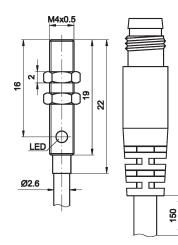

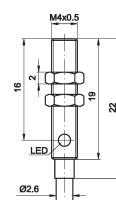

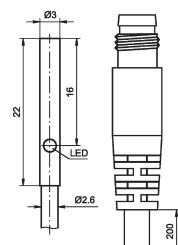

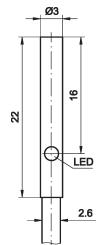

**Warning:** Never use these devices in applications where the safety of a person depends on their functionality!

## 1100 norm sensing ranges, increased sensing ranges

### connection

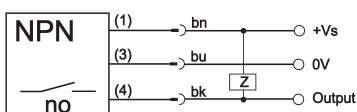

3-pin PNP, no

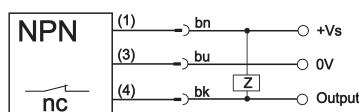

3-pin PNP, nc

3-pin NPN, no

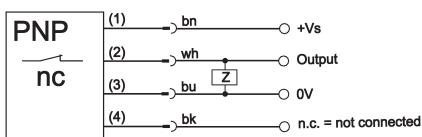

3-pin NPN, nc

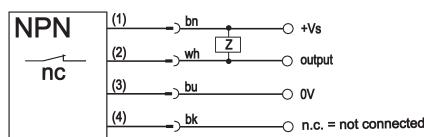

**wire colors:** bn = brown (1), bu = blue (2), bk = black (4)

For devices with M12-connector and normally closed contact function (nc), the switching output is wired via PIN2. For this reason a 4-pin cable socket should be used and the connection made via the white wire.

3-pin, PNP, nc, M12-connector

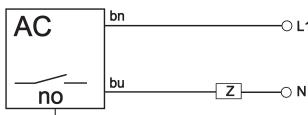

3-pin, NPN, nc, M12-connector

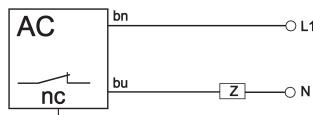

**wire colors:** bn = brown (1), wh = white (2), bu = blue (3)

2-pin, AC, no

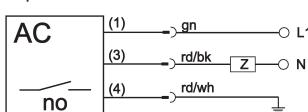

2-pin, AC, nc

**wire colors:** bn = brown (1), bu = blue (2)

3-pin, AC, MC-connector

**wire colors:** gn = green (1), rd/bk = red/black (2), rd/wh = red/white (3)
